In the Claims:

1. (original) A handheld biopsy instrument comprising:
 - a. a hollow, biopsy, insertion needle having an axially extending open specimen port at its distal end,
 - b. an elongated, rotatable, tissue specimen cutter slidably received within said biopsy insertion needle,
 - c. an elongated flexible push rod slidably received within said needle and parallel to said cutter, said push rod extending to the distal end of said needle,
 - d. means for applying a first vacuum within the distal end of said needle whereby a portion of the tissue to be sampled is drawn into said specimen port when said needle is inserted into the tissue to be sampled,
 - e. means for advancing said cutter toward the distal end of said needle,
 - f. means for rotating said cutter as said cutter advances within said needle, whereby said cutter cuts and encapsulates the portion of said tissue contained within said specimen port,
 - g. means for advancing said flexible push rod axially toward the distal end of said needle,
 - h. means at the distal end of said needle for causing said push rod to turn 180 degrees thereby reversing its direction of movement whereby said push rod end enters said cutter, engages said encapsulated tissue specimen therein, thereby moving said tissue specimen axially toward the proximal end of said cutter.
2. (withdrawn).
3. (New) The biopsy instrument of Claim 1 wherein the biopsy insertion needle comprises an upper lumen and a lower lumen .

4. (New) The biopsy instrument of Claim 3 wherein the distal end of the cutter is received within the upper lumen.
5. (New) The biopsy instrument of Claim 3 wherein at least a portion of the push rod is slidably received in the lower lumen .
- 6 (New) The biopsy instrument of Claim 5 wherein lower lumen communicates with a source of vacuum.
7. (New) The biopsy instrument of Claim 1 wherein the specimen tube is removable from the biopsy instrument.
8. (New) The biopsy instrument of Claim 1 wherein the specimen tube and the cutter are configured to advance and retract in unison.
9. (New) A handheld biopsy instrument comprising:
 - a biopsy needle having a tissue piercing distal tip and a tissue receiving port disposed proximal of the tissue piercing distal tip;
 - a hollow cutter having a distal end, wherein the distal end of the cutter is slidably received within the biopsy needle, and wherein the cutter is rotatable and translatable within the biopsy needle for severing tissue received in the tissue receiving port of the biopsy needle;
 - an elongated, flexible push rod, wherein at least a portion of the push rod is slidably received within the needle and extends parallel to the cutter; and
 - a specimen tube for receiving tissue severed by the hollow cutter.
